NIMH/Alpert Medical School of Brown University Research Training Program in Adolescent/Young Adult Biobehavioral HIV Mental Health offers postdoctoral fellowship positions.

The Research Training Program in Adolescent/Young Adult Biobehavioral HIV Research prepares post-residency psychiatrists, postdoctoral psychologists, and behavioral scientists to conduct independent research in the area of biobehavioral HIV as full-time University faculty members. The Program is a two-year fellowship in which research fellows train under the guidance of experienced mentors. It includes didactic work, participation in ongoing funded projects, and independent research. A central characteristic of the Program is its integration of biological and behavioral components to inform HIV research. Trainees receive dual mentorship both from a faculty in the Department of Psychiatry and Human Behavior and a faculty in the Center for AIDS Research. Projects may involve infected, affected or at-risk youth in behavioral or biologic research. Ongoing funded projects target youth in diverse settings (HIV Clinic, mental health treatment, public schools, the RI Family court, detention facilities, and community-based recreational programs), investigate novel interventions (family-based, affect management, gaming, and media) and include biological markers (HIV and other STIs, viral load, immune functioning and stress reactivity). Clinical experiences are also available for appropriate trainees.
