**Job Description**

Independently uses a specialized knowledge of, and experience, with public health principles to analyze, develop, implement, and promote solutions to public health issues/problems. Collects and analyzes data. Prepares proposals, protocols, data analysis plans, reports, manuscripts, and presentation of study findings. Addresses public health issues by providing education, technical assistance, advocacy, public awareness, and research. Works with programs or studies designed to evaluate the prevalence or surveillance of public health issues and the effectiveness of targeted interventions. May coordinate clinical study sites to ensure compliance with patient recruitment and data collection standards. May provide technical assistance to organizations to include presentations, websites, strategies, and educational forums to address specific public health issues. May design, develop, and conduct targeted training initiatives. May collaborate with external organizations to develop action plans and goals to achieve specific objectives. Identifies new potential projects, studies or partners. Performs related responsibilities as required.

**Preferred Qualifications**

An MPH in Epidemiology is preferred. These positions call for a diverse array of skills. Some experiences that will be favorably considered include: HIV prevention research; surveillance data collection and coordination; NIH-or CDC-supported research studies, especially among MSM; writing scientific manuscripts; mobile app development; questionnaire development; conducting qualitative research, including data collection and analysis; epidemiological analyses and study data management.
